

# Cardiopulmonary Resuscitation (CPR)

A Quick Response Can Save a Life

*"An important first aid procedure used when normal breathing stops or a person is unresponsive, aiming to support circulation until specialists arrive"*

# Why Do We Care About Cardiopulmonary Resuscitation?

The first minutes are very important in critical cases

## Supporting the Injured Person

Until the Specialists Arrive

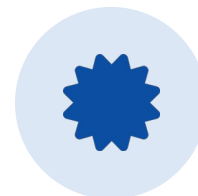

## Reducing Delay

in the Initial Response

## Community Awareness

of How to Act During Crises

## Encouraging Training

and Approved First Aid

## Organizing the Situation

Calmly and Steadily

## A Shared Responsibility

Among Community Members

**Remember:** CPR is an important skill, but approved hands-on training is essential to apply it confidently and correctly

# What Is Cardiopulmonary Resuscitation (CPR)?

Regular chest compressions to temporarily support circulation

**Temporarily  
supporting  
circulation**

**Reducing the  
response delay**

**Buying time for  
the specialists  
to arrive**

**Providing the  
opportunity to  
use an AED**

**Supporting the  
injured  
person's  
breathing**

**Within the  
limits of  
approved  
training**

**Note:** This presentation is for awareness and does not replace approved hands-on training in CPR and first aid

# When Do We Need CPR?

Signs that call for immediate action

The injured person doesn't respond when called

1

There is no normal movement

2

There is no normal breathing

3

Abnormal breathing resembling gasping

4

A sudden collapse with loss of responsiveness

5

Inability to wake them

6

No communication or awareness

7

**Urgent Action:** Make sure the area is safe, request help immediately, and call 999

# The Basic Rule Before Starting

Check for hazards before approaching the injured person

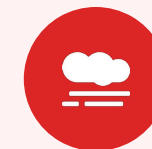

**Vehicle traffic**

**Fire or smoke**

**Exposed  
electricity**

**A gas or fuel  
leak**

**A slippery floor**

**Crowding or  
pushing**

**Sharp objects  
or obstacles**

**Important Message:** Don't start helping if the area is unsafe, and request help immediately via 999

# Initial Response Steps

Act calmly and in clear order

Check for normal breathing

5

Start chest compressions when needed

6

Continue until the specialists arrive

7

Make sure the area is safe

1

Check the injured person's responsiveness

2

Ask someone nearby to call 999

3

Ask for an AED to be brought if available

4

**Note:** If you're untrained, follow the emergency operator's instructions over the phone

# Requesting Help Quickly

An essential step that must not be delayed

Tell the operator:

The presence of an AED

The breathing status

Unresponsive

The precise location

The precise  
location of the  
case

The injured  
person's  
approximate  
age

Are they  
breathing  
normally?

The hazards at  
the site

**Important Message:** Don't end the call unless the emergency operator asks you to

# Checking Responsiveness and Breathing

A quick check to determine the need for urgent action

**Call the injured person in a clear voice**

**Check for a response**

**Observe for normal breathing**

**Don't waste a lot of time**

**Request help immediately**

**Gasping is not normal breathing**

**Note:** Abnormal breathing or gasping is not treated as normal breathing — request help immediately

# Chest Compressions

The core part of CPR to temporarily support blood flow

**The injured person on a firm, flat surface**

1

**Compressions in the center of the chest**

2

**Strong, regular compressions**

3

**Don't stop without an important reason**

4

**Allow the chest to recoil between compressions**

5

**Follow the 999 operator's instructions**

6

**Awareness Message:** Starting chest compressions quickly can be better than waiting without doing anything

# CPR for the Untrained

Lack of training doesn't stop you from requesting help and organizing the area

**Make sure the area is safe**

**Call 999 immediately**

**Turn on the speakerphone**

**Follow the instructions step by step**

**Perform the compressions if instructed**

**Ask for an AED to be brought**

**Note:** Lack of training doesn't stop you from calling, requesting help, and organizing the area

# CPR for the Trained

More organized care according to the approved course

**Follow what  
you learned in  
training**

**Assess the  
safety of the  
area**

**Start  
compressions  
when needed**

**Use an AED  
when available**

**Continue until  
the specialists  
arrive**

**Avoid acting  
outside your  
training**

**Important Message:** Hand placement, rhythm, and depth are practical skills that require hands-on training, not theoretical explanation

# The Automated External Defibrillator (AED)

A device that may be available in public places

Ask for an AED to be brought if available

1

Turn on the device as soon as it arrives

2

Follow the voice instructions

3

Keep others away when the device instructs

4

Don't use the device randomly

5

Follow the 999 operator's instructions

6

**Note:** The use of the AED will be explained in more detail in a separate topic

# When Do We Continue and When Do We Stop?

Continuing is important until the condition changes or help arrives

The arrival of specialized response teams

1

The return of normal breathing

2

The appearance of clear signs of responsiveness

3

Being instructed to stop by the 999 operator

4

Physical inability to continue

5

**Important Message:** If you feel exhausted and another trained person is present, you can take turns in an organized way

# Cases of Children and Infants

They require special training because the method of handling is different

**Request help immediately**

1

**Call 999**

2

**Don't apply what you haven't been trained in**

3

**Follow the emergency operator's instructions**

4

**Don't shake the child or infant violently**

5

**Secure the area and disperse the crowd**

6

**Stay calm until the specialists arrive**

7

**Important Note:** CPR for children and infants is a skill requiring approved hands-on training

# Common Mistakes to Avoid

Delaying help or increasing confusion at the site

**Delaying the  
call to 999**

**Approaching  
an unsafe area**

**Crowding  
around the  
injured person**

**Stopping  
compressions  
without a  
reason**

**Giving water to  
an unconscious  
person**

**Filming or  
posting the  
case**

**Applying  
unfamiliar  
steps**

**Awareness Message:** The correct response begins with calmness, requesting help, and not improvising incorrectly

# The Role of Those Present at the Scene

Organizing the response among those present reduces chaos

**Someone calls  
999**

**Someone  
brings an AED**

**Someone  
disperses the  
onlookers**

**Someone  
clears the way  
for the  
ambulance**

**Someone  
provides the  
injured  
person's  
information**

**A trained  
person starts  
CPR**

**Important Message:** Organizing those present reduces chaos and helps the specialists when they arrive

# After the Response Teams Arrive

Make room and provide the important information

**Move away  
from the  
injured person  
if they ask**

**Tell them what  
happened  
clearly**

**State when the  
loss of  
responsiveness  
began**

**State if CPR  
was performed**

**State if an AED  
was used**

**Follow their  
instructions  
and don't  
hinder their  
work**

**Note:** After the specialists arrive, the role of those present is only to help with organization and provide information

# Do's and Don'ts During Cardiopulmonary Resuscitation

Correct Practices and Others to Avoid

## Don't ✕

- Don't delay requesting help ❶
- Don't enter a dangerous area ❷
- Don't feed an unconscious person ❸
- Don't crowd around the injured person ❹
- Don't stop CPR without a reason ❺
- Don't apply what you haven't been trained in ❻
- Don't film or post the injured person ❼

## Do ✓

- Make sure the area is safe ❶
- Check the injured person's responsiveness ❷
- Call 999 immediately ❸
- Ask for an AED to be brought ❹
- Start chest compressions when needed ❺
- Follow the emergency operator's instructions ❻
- Make room for the response teams ❼

# Interactive Scenarios

Practical Application of What You've Learned

## Scenario 2

**You're untrained and saw an unresponsive person**

**Correct Action:** Call 999 immediately, turn on the speakerphone, and follow the operator's instructions step by step

## Scenario 1

**An adult suddenly collapsed and is unresponsive and not breathing normally**

**Correct Action:** Secure the area, call 999, ask for an AED, and start compressions per the instructions

## Scenario 4

**People gathered around the injured person and started filming**

**Correct Action:** Disperse the onlookers, stop the filming, and provide space for the injured person and the response teams

## Scenario 3

**There's an AED near the location of the case**

**Correct Action:** Bring the device, turn it on, and follow the voice instructions along with the 999 operator's guidance

# Test Your Knowledge

Quick Questions to Assess Your Understanding

**Q1: What is the first step before helping an unresponsive person?**

**Answer:** Making sure the area is safe and there's no danger to the rescuer, the injured person, or those present

**Q2: What number should you call in an emergency?**

**Answer:** Call 999 immediately

**Q3: When do we generally start CPR?**

**Answer:** When the person is unresponsive and not breathing normally, while requesting help immediately

**Q4: What do you do if you're not trained in CPR?**

**Answer:** Call 999, turn on the speakerphone, and follow the operator's instructions step by step

# Thank You

CPR is an important first aid skill — hands-on training builds confidence in applying it

**Area safety • Call 999 • Start compressions • Use an AED • Follow emergency instructions**

***"Learning CPR today may make you the reason a life is saved tomorrow"***
