

First Aid Basics

Your Mindful Action in the First Minutes Makes a Difference

"First aid consists of simple, organized steps provided in the first minutes to protect life and reduce the worsening of an injury"

Why Do We Care About First Aid?

The correct action in the first minutes protects the injured person

Protecting Life

in the First Moments

Reducing Worsening

in Injuries and Conditions

Reassuring the Injured Person

and Those Around Them

Supporting the Specialists

With Clear Information

Avoiding Mistakes

That May Increase the Danger

A Community Responsibility

and Collective Awareness

Remember: First aid does not replace specialists, but means acting correctly until they arrive

What Is Meant by First Aid?

Temporary initial care before the specialists arrive

**Securing the
area before
approaching**

**Assessing the
injured
person's
condition**

**Requesting
help from the
specialists**

**Providing
simple, safe
care**

**Monitoring and
reassuring the
injured person**

**Avoiding any
untrained
intervention**

Note: The priority is always personal safety and the safety of the injured person and those present

The Basic Rule: Check, Call, Help

A simple, organized sequence during emergencies

1

Check

the safety of the area and the injured person's condition without putting yourself in danger

2

Call

the competent authorities when there's an emergency or a serious injury

3

Help

within the limits of your knowledge and training until the specialists arrive

Awareness Message: An organized response reduces confusion and helps you make the right decision

Securing the area before approaching

Check for Hazards Before Providing Help

Vehicle traffic

Fire or smoke

**A gas or fuel
leak**

**Exposed
electrical
wiring**

**Falling objects
or glass**

**Crowding or
pushing**

**Harmful
chemicals**

Correct Action: If the area is unsafe, don't approach, move to a safe place, and request help immediately

Protect Yourself First

You can't help others if the rescuer themselves is in danger

Don't enter a dangerous site

Use gloves or a barrier

Avoid direct contact with blood

Wash your hands after helping

Don't intervene beyond your knowledge

Ask another person for support

Important Message: Your safety is part of the first aid process, not a secondary matter

Assessing the injured person's condition

Ask yourself calm questions to assess the situation

Is the injured person conscious and speaking?

1

Are they breathing normally?

2

Is there an obvious injury?

3

Are there signs of bleeding or pain?

4

Are they able to move?

5

Are there signs of danger in the area?

6

Note: Don't move the injured person if a head, neck, or back injury is suspected, except in case of an immediate danger

When Do We Request Help Immediately?

Cases that call for immediately contacting emergency services

Serious or extensive burns

5

Loss of consciousness or weak responsiveness

1

A suspected fracture or head injury

6

Difficulty breathing or its cessation

2

Signs of a stroke or seizures

7

Severe chest pain

3

Poisoning or ingesting a dangerous substance

8

Severe bleeding or a major injury

4

Emergency Numbers: 998 for Ambulance • 999 for Police and General Emergencies • 997 for Civil Defence

What Do You Say When Calling Emergency Services?

Clear information helps specialists respond quickly

Information to Provide to Emergency Services:

"Precise location • Type of case • Number of injured • Are they conscious and breathing? • Presence of bleeding or fire"

**The precise
location of the
case**

**The type of
injury**

**The number of
injured**

**A contact
number**

Important Message: Speak calmly, and don't end the call until the operator asks you to

Reassuring the Injured Person

Calmness is an important part of first aid

Speak in a calm, clear voice

Introduce yourself and mention that help is being requested

Encourage them to stay calm

Don't make uncertain promises

Don't leave them alone if it's safe

Keep onlookers away and provide privacy

Note: Fear and confusion can make the situation harder — calmness helps the injured person and those around them

Managing Wounds and Minor Bleeding

Cleanliness, disinfection, and reducing complications

Wash your hands or use gloves

Apply pressure with a clean bandage

Cover the wound with a clean dressing

Don't touch the wound without protection

Don't apply non-designated substances

Seek help in case of severe bleeding

Important Message: In severe bleeding or a major injury, don't rely on basic first aid — request help immediately

Managing Minor Burns

A calm, quick response to reduce pain and the worsening of the injury

Move the injured person away from the heat source

Cool with cool or lukewarm running water

Don't use ice directly

Don't apply oils or paste

Cover with a clean, non-adhesive dressing

Seek help for large burns

Note: Burns from electricity, chemicals, or a large fire require immediate medical help

Fainting and Dizziness

They may occur due to fatigue, heat, or dehydration

**Help them sit
in a safe place**

**Move them
away from
crowds and
heat**

**Make sure
there is
adequate
ventilation**

**Don't give
them food if
they're
unconscious**

**Monitor their
breathing and
responsiveness**

**Call an
ambulance if
the fainting
persists**

Important Message: Don't treat repeated or prolonged fainting as a minor matter

Choking

An emergency requiring quick action

Severe difficulty breathing

1

Inability to speak

2

A change in the color of the face or lips

3

Putting the hands on the throat

4

Request help immediately

5

Encourage them to cough if able

6

Don't put your hand in the mouth randomly

7

Note: Detailed handling of choking requires training and will be covered in a separate topic

Suspected Poisoning

Chemicals, medications, or spoiled food

**Move them
away from the
source of
danger**

**Don't force
them to vomit**

**Don't give
them food
without a
specialist's
guidance**

**Keep the
substance's
container**

**Call emergency
services
immediately**

**Open
ventilation
safely**

Important Message: In poisoning cases, correct information about the substance can help specialists make the right decision

Suspected Bone Injury or a Fall

Act carefully to avoid worsening the injury

Don't move the injured part

Help them stay still

Don't try to reset the bone

Use a simple support if you're trained

Seek help in case of severe pain

Don't move a head or neck injury

Note: Mishandling fall injuries can increase pain or worsen the injury

Common Mistakes in First Aid

Actions that may increase the danger instead of helping

**Approaching
an unsafe area**

**Moving the
injured person
unnecessarily**

**Feeding an
unconscious
person**

**Using folk
remedies**

**Crowding
around the
injured person**

**Filming or
posting the
injured person**

**Delaying the
call to
emergency
services**

Awareness Message: Not knowing is not a fault, but an unsafe action can be dangerous

Do's and Don'ts in First Aid

Correct Practices and Others to Avoid

Don't ✗

- Don't put yourself in danger 1
- Don't move the injured person unnecessarily 2
- Don't perform an intervention you don't know 3
- Don't give medication without medical guidance 4
- Don't apply non-designated substances 5
- Don't delay calling emergency services 6
- Don't film the injured person or post the incident 7

Do ✓

- Check the safety of the area first 1
- Seek help in serious cases 2
- Stay calm and reassure the injured person 3
- Use gloves or a protective barrier 4
- Provide help within the limits of your knowledge 5
- Keep onlookers away and provide space 6
- Wait for the specialists and follow their instructions 7

Interactive Scenarios

Practical Application of What You've Learned

Scenario 2

A child got a minor hand wound while playing

Correct Action: Wash your hands or use gloves, apply pressure with a clean bandage, and cover the wound

Scenario 1

A person fell and is complaining of severe back pain

Correct Action: Don't move them, secure the area, reassure them, and call an ambulance immediately

Scenario 4

A small fire occurred and a person sustained a burn

Correct Action: Move them away from the source, cool the burn with water, don't apply folk remedies, and seek help

Scenario 3

A person felt dizzy in a hot, crowded place

Correct Action: Move them to a safe, ventilated place, help them sit, and monitor their condition

Test Your Knowledge

Quick Questions to Assess Your Understanding

Q1: What is the first step before helping any injured person?

Answer: Making sure the area is safe and not putting yourself or others in danger

Q2: When should you call an ambulance or emergency services?

Answer: In case of a serious injury, loss of consciousness, severe bleeding, poisoning, or an immediate danger

Q3: Is it acceptable to move the injured person right after a fall?

Answer: No, unless there's an immediate danger threatening their life

Q4: Why should crowding around the injured person be avoided?

Answer: It obstructs ventilation and the arrival of help, increases confusion, and puts everyone at risk

Thank You

First aid begins with awareness, calmness, and training

Your safety first • Check, then call, then help • Don't move the injured person • Call 999

"Your mindful action in the first minutes can make a big difference"
