

Preventing Smoke and Carbon Monoxide Hazards

An invisible danger... and prevention that begins with awareness

"Preventing smoke and carbon monoxide begins with early warning and proper ventilation"

Why Do We Talk About Smoke and Carbon Monoxide?

The risks of gases produced by combustion can be more dangerous than flames

Reducing suffocation

preventing smoke inhalation

Preventing poisoning

carbon monoxide is a silent killer

The importance of the alarm

detecting danger before it happens

The danger of charcoal

and generators in enclosed spaces

The correct action

when gas is suspected

Protecting the family

children and the elderly are more affected

Remember: Not seeing the danger doesn't mean it isn't there

What Is the Difference Between Smoke and Carbon Monoxide?

Each has different characteristics and risks

Smoke is visible and has a smell

Carbon monoxide is colorless

Smoke irritates the eyes

Carbon monoxide is odorless

Smoke reduces visibility

Carbon monoxide can't be detected by the senses

Smoke contains harmful gases

Message: Smoke is noticeable, but carbon monoxide can only be detected with a dedicated alarm

Sources of Smoke and Carbon Monoxide

Potential sources with misuse or poor ventilation

Home fires

Charcoal and
grills

Fuel heaters

Water heaters

Electric
generators

Vehicles in
garages

Ovens and
stoves

Remember: Any combustion source inside an enclosed place needs ventilation, inspection, and safe use

Risks of Smoke Inhalation and Carbon Monoxide Exposure

Their effects on breathing, vision, and the ability to get out

Confusion and difficulty concentrating

5

Reduced visibility in corridors

6

Confusion during evacuation

7

Loss of consciousness in severe cases

8

Difficulty breathing

1

Irritation of the eyes, nose, and throat

2

Coughing and dizziness

3

Headache and nausea

4

Important Message: If more than one person feels similar symptoms in the same place, there may be a danger

Smoke and Carbon Monoxide Alarms

An early warning that gives you time to act

**Install smoke
alarms**

**Install CO
alarms near
combustion
sources**

**Test the
devices
regularly**

**Don't cover or
disable the
devices**

**Replace the
batteries as
instructed**

**Make sure the
alarm can be
heard in the
bedrooms**

**Leave
immediately
when the alarm
goes off**

Remember: The alarm doesn't prevent the danger, but it gives you time to act

Ventilation and Safe Use of Combustion Sources

Ventilation reduces the buildup of smoke and gases

Don't use charcoal in enclosed spaces

1

Don't run generators inside the house

2

Don't run vehicles in closed garages

3

Inspect heating devices regularly

4

Don't block the ventilation openings

5

Follow the manufacturer's instructions

6

Call specialists when there is a malfunction

7

Message: Prevention starts by avoiding combustion sources in unsuitable places

What Do You Do When There Is Smoke?

Act quickly and calmly, and avoid approaching the danger

Stay low while exiting

5

Close the doors behind you

6

Call 999 from a safe location

7

Inform the specialists of the location

8

Move away from the smoke immediately

1

Don't approach to take photos or watch

2

Don't open a door with smoke coming out of it

3

Use the nearest safe exit route

4

Remember: Don't enter a smoke-filled area even if you don't see flames

What Do You Do When You Suspect Carbon Monoxide?

The priority is getting outdoors and seeking help

Go outdoors immediately

Don't search for the source inside the location

Tell those present to leave

Call 999 from a safe location

Don't return until the danger is gone

Request a device inspection from a specialist

Get help immediately for the injured

Message to Employees: Getting out quickly matters more than trying to find the source of the danger

First Aid for Those Affected by Smoke or Gas

Safety first before attempting to help

Make sure the place is safe

Move the injured person to a well-ventilated place

Open their airway

Don't put yourself at risk

Call 999 immediately

Monitor their breathing and consciousness

Message: Quick evacuation from the hazardous environment matters more than any first aid

Protecting the Most Vulnerable Groups

Some groups are affected by smoke and gas more quickly

Children

More affected by toxic gases

The elderly

Weaker breathing and slower movement

People of Determination

Difficulty evacuating quickly

Pregnant women

Double risk to the fetus

Respiratory illnesses

Quickly affected by smoke

Sleeping people

Don't notice the danger

Message: Prevention must account for the needs of all family members

Steps After the Danger Has Passed

A safe return requires confirmation from specialists

Wait for the relevant authorities' clearance

Don't turn on any device before inspection

Open the windows to ventilate

Check the alarm devices

Inform the specialist about the causes

See a doctor if needed

Take precautions in the future

Document the incident for follow-up

Remember: Returning too early may expose the family to ongoing danger

Special Cases in Gas Prevention

Some situations call for extra caution

Burning charcoal on trips

Heaters in tents and rest areas

Vehicles parked for long periods

Running generators near windows

Poorly maintained water heaters

Ovens inside closed kitchens

Storing fuel near living areas

Important Message: Every combustion source needs a safe location and adequate ventilation

Reporting and Communication During Danger

A clear report speeds up the arrival of help

Example of a clear report:

"There is a burning smell and smoke on the second floor of the house, and several people feel a headache"

State the
location
precisely

Mention the
type of danger

Report the
injured

Avoid spreading
unconfirmed
information

Remember: An accurate report saves lives and speeds up the arrival of help

Do's and Don'ts in Smoke and Gas Prevention

Correct Practices and Others to Avoid

Don't ×

- Don't use charcoal in enclosed spaces
- Don't run vehicles in closed garages
- Don't use generators inside the house
- Don't ignore the alarm sound
- Don't enter a smoke-filled area
- Don't ignore headaches and dizziness
- Don't return before official clearance

1

2

3

4

5

6

7

Do ✓

- Install alarm devices
- Test the devices regularly
- Provide adequate ventilation
- Use generators outdoors
- Report any burning smell
- Leave when you suspect danger
- Call 999 when needed

Interactive Scenarios

Practical Application of What You've Learned

Scenario 2

You noticed heavy smoke in the building corridor

Correct Action: Don't enter the corridor; use an alternative route or call emergency services

Scenario 1

A CO alarm went off inside the house

Correct Action: Go outside immediately to a well-ventilated spot, alert those present, and call emergency services

Scenario 4

The generator is running near an open window

Correct Action: Stop its use safely, and move the generator to a distant outdoor location

Scenario 3

Someone wants to use charcoal in an enclosed place

Correct Action: Stop them immediately and explain the danger of carbon monoxide

Test Your Knowledge

Quick Questions to Assess Your Understanding

Q1: Can carbon monoxide be seen or smelled?

Answer: No, it is a colorless, odorless gas

Q2: What do you do when there is heavy smoke in the corridor?

Answer: I don't enter the corridor, and I use an alternative route or ask for help

Q3: Is it allowed to use charcoal in enclosed spaces?

Answer: No, because it can produce carbon monoxide gas

Q4: Where should the electric generator be used?

Answer: Outdoors only, and away from windows and doors

Q5: Why are alarm devices important?

Answer: They warn early when there is smoke or a rise in carbon monoxide levels

Thank You

Preventing smoke and carbon monoxide hazards is everyone's responsibility

Install the alarm • No charcoal indoors • Generators outdoors • Leave when you suspect danger • Call 999

"Awareness of the invisible danger can save lives"
