

Safety from Electrical Generators

Backup power... with safe use

"An electric generator is a helpful tool, but using it unsafely can put lives and property at risk"

Why Do We Care About Electrical Generator Safety?

Unsafe use can turn the generator into a source of danger

Preventing poisoning

from carbon monoxide

Reducing fires

from fuel and heat

Preventing electric shock

from unsafe connections

Protecting the family

and workers at the site

Protecting property

and electrical appliances

Ensuring safe operation

and following instructions

Remember: The biggest danger with generators may be invisible, like carbon monoxide gas

Key Risks of Electrical Generators

Resulting from an unsuitable location or unsafe connections

**Carbon
monoxide gas**

**A fire breaking
out**

Electric shock

**Overloading
the generator**

**Running near
windows**

**Use inside the
house**

**Unsafe fuel
storage**

Message: The generator needs a safe location, good ventilation, and certified connections

The Safe Location for Running the Generator

Choosing the location is the most important step for risk prevention

Run the generator outdoors only

Don't run it inside the house

Don't run it in the garage

Keep it away from windows and doors

Place it in a well-ventilated spot

Don't place it in walkways

Make sure it's stable on a suitable surface

Remember: Running the generator in a semi-enclosed place can allow dangerous gas to build up

Preventing Carbon Monoxide

A colorless, odorless gas that can cause a major health risk

Test the alarm devices regularly

5

Leave immediately when the alarm goes off

6

Don't return before confirming the danger is gone

7

Inform a specialist if symptoms recur

8

Don't use the generator in enclosed spaces

1

Don't run it near sleeping or sitting areas

2

Keep it away from air intakes and windows

3

Install CO alarms in the house

4

Important Message: If you feel a headache or dizziness while it's running, go outdoors immediately

Electrical Safety When Using the Generator

Unsafe connections can cause shock or fire

Use certified connections

Don't use damaged wires

Don't run wires through water

Don't overload the generator

Don't connect to the house except via a specialist

Keep connections away from children

Unplug appliances before shutting down

Remember: Connecting the generator incorrectly can put users and workers at risk

Fuel and Safe Storage

Fuel is a flammable material and must be handled with care

Store fuel in certified containers

1

Keep it in a well-ventilated place

2

Don't store it inside living areas

3

Keep fuel away from children

4

Don't leave the containers open

5

Don't refuel the generator while it's hot

6

Wipe up any spill before starting

7

Message: Fuel needs safe storage and constant monitoring to avoid fires

Starting and Stopping the Generator Safely

Proper start-up and shutdown steps reduce malfunctions and risks

Keep flammable materials away

5

Read the manufacturer's instructions

1

Don't leave the generator unattended

6

Check the location and ventilation

2

Shut it down as instructed

7

Check the fuel and oil

3

Let it cool before storing

8

Make sure the wires are intact

4

Remember: Organized start-up and shutdown steps extend the generator's life and maintain safety

Using the Generator During Bad Weather

Rain and humidity increase the risk of electric shock

Don't touch the generator with wet hands

Don't run it where water can reach it

Use suitable rain protection

Don't place it in an enclosed space

Keep connections away from water

Stop use at any sign of danger

Follow the official weather alerts

Message to Employees: Rain protection doesn't mean running the generator inside the house or garage

Warning Signs While Using the Generator

Stop immediately when you notice any sign

Strong fuel smell

Fuel leak

Abnormal smoke

Excessive heat

Unusual noise

Damaged wiring

Message: Shut it down safely, move away, and inform a specialist or call 999

Protecting the Most Vulnerable Groups

Some groups need extra care around generators

Children

Drawn to devices and wires

The elderly

Quickly affected by gas and shock

People of Determination

Difficulty moving quickly

The ill

Affected by gases and heat

Pregnant women

Double risk to the fetus

Visitors

Unfamiliar with the site

Message: Keeping sensitive groups away from generators is a priority every time

What Do You Do When an Emergency Occurs?

Act quickly and calmly in case of fire, leak, or smoke

Stay calm

**Move away from
the generator**

**Shut it down if
it's safe**

**Move people
away**

**Don't touch the
connections**

**Go out to a well-
ventilated place**

**Inform a
specialist**

**Call 999 in case
of danger**

Remember: Don't risk trying to handle a danger that's out of control

Special Cases in Generator Use

Some uses call for extra caution

Generators on trips

Generators in workshops

Generators on farms

Running for long hours

Use with varying loads

Presence of children at the site

Harsh weather conditions

Important Message: Every use environment needs a prior risk assessment

Communication and Reporting During a Generator Emergency

A clear report speeds up the response and reduces risks

Example of a clear report:

"There is smoke from an electric generator in the yard, and two people feel a headache and nausea"

State the
location
precisely

Mention the
type of danger

Report the
injured

Avoid spreading
unconfirmed
information

Remember: An accurate report saves lives and speeds up the arrival of help

Do's and Don'ts When Using Generators

Correct Practices and Others to Avoid

Don't ×

- Don't run it inside the house or garage
- Don't refuel it while it's running
- Don't overload the generator
- Don't use damaged wires
- Don't touch it with wet hands
- Don't ignore a headache or dizziness
- Don't leave it unattended

1

3

4

5

6

7

Do ✓

- Run the generator outdoors only
- Keep it away from windows and doors
- Use certified connections
- Store fuel in safe containers
- Install CO alarms
- Read the instructions before use
- Call 999 when needed

Interactive Scenarios

Practical Application of What You've Learned

Scenario 2

A CO alarm went off while the generator was running

Correct Action: Go outside immediately to a well-ventilated place, alert those present, and call 999

Scenario 1

Someone wants to run the generator in the garage with the door open

Correct Action: It must never be run in the garage; it should be placed outdoors away from windows

Scenario 4

You need to run the generator during rain

Correct Action: Don't run it where water can reach it; use protection with an open, ventilated location

Scenario 3

You noticed a fuel leak near the generator

Correct Action: Shut it down safely, move away from the site, and don't run it before the issue is fixed

Test Your Knowledge

Quick Questions to Assess Your Understanding

Q1: Where should the electric generator be run?

Answer: Outdoors only, in a well-ventilated place away from windows

Q2: Is it allowed to run the generator in the garage if the door is open?

Answer: No, because carbon monoxide gas can build up and enter the house

Q3: Why shouldn't fuel be added while the generator is running?

Answer: Because fuel is flammable and can cause a fire

Q4: What do you do if you feel a headache while the generator is running?

Answer: I go outdoors immediately and ask for help

Q5: Is it allowed to connect the generator to the house wiring without a specialist?

Answer: No, it must be done by a specialist using certified systems

Thank You

Safety from electrical generators is everyone's responsibility

Outdoors only • Away from windows • Certified connections • Safe fuel • Call 999

"Safe generator use provides power when needed and protects lives and property"
