

Managing Electricity and Gas Risks

Prevention, maintenance, and correct action during emergencies

"An electrical hazard or gas leak requires safe action and specialists, not individual guesswork"

Why Do We Care About Managing Electricity and Gas Risks?

Any fault can turn into a major hazard

Protecting lives

in homes

Reducing fires

electrical ones

Preventing

gas leaks

Protecting children and the elderly

Reducing faults

and overloading

A culture of reporting

early

Remember: An electrical hazard or gas leak leaves no room for experimentation or guesswork

What Is Meant by Managing Electricity and Gas Risks?

Identify, reduce, prepare

**Inspect
appliances
periodically**

**Follow the
manufacturer's
instructions**

**Do not
overload
sockets**

**Ventilate areas
with gas**

**Turn off the gas
after use**

Report faults

**Call 999 in case
of danger**

Note: Risk management does not mean repairing it yourself, but knowing when to stop and call the specialists

The Main Electrical Hazards

Electric shock, fire, and appliance damage

**Overloading
sockets**

**Damaged
wiring**

**Unattended
appliances**

**Appliances
near water**

**High-
consumption
appliances**

**Unapproved
chargers**

**Repair without
a specialist**

Awareness Message: Any spark, burning smell, or abnormal heat is a danger indicator

Overloading Sockets

Overheating, melting, and fire

**High-power
appliances in
one socket**

**Poor-quality
connectors**

**Wires under
the carpet**

**A long
extension
instead of
proper wiring**

**Ignoring a hot
plug**

Correct Action: Unplug unused appliances, and request a specialist inspection if faults recur

Electricity and Water

Their combination increases the risk of shock and fire

Do not use it while wet

1

Keep appliances away from sinks

2

Do not switch on an appliance that fell in water

3

Cut the power from a safe place

4

Do not touch a person being electrocuted

5

Request help immediately

6

Important Note: Do not approach exposed or wet wiring — call 999 in case of danger

Electrical Appliances in the Home

Correct use and proper maintenance

**Follow the
manufacturer's
instructions**

**Unplug what is
not in use**

**Do not use
anything
giving off a
smell**

**Do not cover
what needs
ventilation**

**Keep hot items
away from
fabrics**

**Inspect the
wires
periodically**

**No damaged
appliances**

Important Message: Damaged appliances are not just an operating problem, but can be a source of danger

Charging and Battery Hazards

Chargers and batteries can be dangerous

**Original,
approved
chargers**

**No charging on
top of beds**

**No swollen
batteries**

**No charging in
the heat**

**Do not cover
the charger**

**Unplug if it
overheats**

**Keep children
away**

Note: A damaged or swollen battery must not be used or opened

The Main Gas Hazards

Fire, explosion, or suffocation

Damaged connections

Leaving the gas on

Poor ventilation

Unsuitable cylinders

Ignoring the smell of gas

Lighting a flame during a leak

Unsafe storage

Awareness Message: A gas smell is not normal — it must be treated as a sign of danger

What to Do When You Suspect a Gas Leak

Avoid any source of sparks or flame

Do not light any flame

1

Do not operate electrical switches

2

Open the windows if it is safe

3

Turn off the gas source if possible

4

Evacuate the area calmly

5

Move away to a safe place

6

Call 999 in case of danger

7

Important Note: Do not search for the source of the leak using fire or a lighter

Ventilation and Carbon Monoxide

Poor ventilation increases the danger

**Well-ventilated
areas**

**No generators
inside the
home**

**No charcoal in
an enclosed
space**

**No running
vehicle in a
closed garage**

**Headache or
dizziness**

**Go out into
fresh air**

Correct Action: If symptoms appear, leave the area and call 999

Gas Cylinder Safety

Correct storage and use

A well-ventilated place

Away from heat

A sound regulator and hose

No cracked hose

Turn off after use

No storage in bedrooms

Specialist inspection when in doubt

Important Message: A safe cylinder is one kept according to instructions, away from sources of danger

Electricity and Gas in the Kitchen

Heat, electricity, and gas in one place

Do not leave cooking

Keep electricity away from water

No wires near the stove

Turn off the gas after use

No electricity during a gas leak

Clean grease buildup

Keep children away

Note: The kitchen is one of the places that needs constant supervision

Electricity and Gas Outdoors

Humidity, heat, and dust

**Equipment for
outdoor use**

**Keep away
from water**

**No exposed
connectors**

**No damaged
appliances**

**No generators
in an enclosed
space**

**No cylinders in
the sun**

**Disconnect in
case of danger**

Awareness Message: What is fine indoors may not be safe for outdoor use

Electric Generator Safety

A severe hazard if used in an unsuitable place

Do not use them in an enclosed space

1

Place them outdoors with good ventilation

2

Keep them away from windows

3

Do not refuel while running

4

Keep fuel away from heat

5

Do not connect them to the home network randomly

6

Follow the manufacturer's instructions

7

Important Note: Running a generator in an enclosed space can cause a severe hazard due to harmful gases

Warning Signs That Must Not Be Ignored

Electricity and gas

Sparks from a socket

A burning smell

Abnormal heat

Frequent outages

A clear gas smell

The sound of a leak

A headache in an enclosed space

An abnormal flame

Correct Action: Stop use, move away, and request a specialist inspection or call 999

The Responsibility of the Family and the Facility

Safety is a shared responsibility

Teaching the
warning signs

Keeping
materials away
from children

Inspecting
appliances

Turning off the
gas

Periodic
maintenance
of the facility

Reporting
training

Emergency
plans

Important Message: Reporting danger early prevents accidents before they occur

What to Do in an Electrical Fire or Gas Hazard?

Focus on evacuation and requesting help

Close the door behind you

5

Move away to a safe place

6

Call 999 immediately

7

Do not touch electricity or gas sources

1

No water on a live electrical source

2

Get out if the danger is increasing

3

Evacuate those present calmly

4

Note: Do not try to control an electrical or gas hazard if it is not safe

Do's and Don'ts with Electricity and Gas

Correct Practices and Others to Avoid

Don't ✗

- Do not overload sockets
- No appliances near water
- Do not repair faults yourself
- No electricity during a gas leak
- No generator in an enclosed space
- Do not touch exposed wires
- Do not delay evacuation

1

2

3

4

5

6

7

Do ✓

- Inspect appliances periodically
- Use approved chargers
- Unplug overheating appliances
- Turn off the gas after use
- Provide adequate ventilation
- Report any smell
- Call 999 in case of danger

Interactive Scenarios

A practical application of what you have learned

Scenario 2

You notice sparks and a burning smell from a socket

Correct Action: Stop use if safe, do not touch the wires, move people away, and request an inspection or call 999

Scenario 1

You smell a clear gas odor in the kitchen

Correct Action: Avoid electrical switches and flames, ventilate the area if safe, turn off the gas, move away, and call 999

Scenario 4

A child is tampering with a damaged charger cable

Correct Action: Move the child away immediately, unplug the charger if safe, dispose of it, and educate the family

Scenario 3

Someone wants to run a generator inside a closed garage

Correct Action: Stop them, move the generator outdoors with good ventilation, away from doors and windows

Test Your Knowledge

Quick Questions to Assess Your Understanding

Q1: What is the correct action when you suspect a gas leak?

Answer: Avoid switches and flames, ventilate if safe, move away, and call 999 in case of danger

Q2: Is it acceptable to use water on a live electrical source?

Answer: No, it may increase the risk of shock or fire

Q3: Why do we not use a generator in an enclosed space?

Answer: Because it produces harmful, dangerous gases; it must be run outdoors with good ventilation

Q4: What is the importance of maintenance and periodic inspection?

Answer: It helps detect faults and leaks before they turn into fires or injuries

Thank You

Prevention begins with awareness and daily commitment to safety measures

Do not ignore smells • Sound appliances • No self-repair • Adequate ventilation • Call 999

"Electricity and gas safety begins with your awareness of the risks and your correct action at the first sign"
