

Carbon Monoxide Safety at Home

An invisible gas... prevention is essential

"A colorless, odorless gas that can pose a major health hazard"

What is carbon monoxide?

A toxic gas produced from incomplete fuel combustion

Colorless

It cannot be seen

Odorless

It cannot be smelled

Tasteless

It cannot be tasted

Spreads silently

In enclosed spaces

Rapid effect

At high concentrations

Remember: The danger of carbon monoxide is that it can be present without anyone noticing

Sources of carbon monoxide at home

Devices that rely on combustion or fuel

Fuel heaters

Water heaters

Charcoal and
grills

Electric
generators

Vehicles in the
garage

Faulty ovens or
poor
ventilation

Non-indoor
heating
devices

Message: Any combustion device needs ventilation, maintenance, and proper use

Why is carbon monoxide dangerous?

It reduces oxygen reaching the body

Symptoms without clear cause

Health-related and clear

Quick effect

On children and the elderly

Risk while sleeping

During exposure

Buildup in enclosed spaces

With poor ventilation

Loss of consciousness

In severe cases

Remember: Good ventilation and alarms help detect the danger early

Symptoms of carbon monoxide exposure

Similar to fatigue or general illness

Headache

Dizziness

Nausea

Unusual
tiredness

Shortness of
breath

Difficulty
concentrating

Loss of
consciousness

Important indicator: If symptoms appear in multiple people, or improve once outside, there may be a danger

Carbon monoxide alarms

Warn early when levels become dangerous

Install them in proper locations

Follow the manufacturer's instructions

Test them regularly

Do not cover or disable them

Replace the batteries

Make sure they can be heard while sleeping

Message: The alarm doesn't prevent the danger, but it warns you to act quickly

Ventilation and maintenance

The most important ways to prevent gas buildup

**Regular
appliance
maintenance**

**Open
ventilation
openings**

**No fuel devices
in closed
spaces**

**No charcoal
inside the
home**

**Don't run a
vehicle in a
garage**

**Installation by
specialists**

**Report any
malfunction**

Remember: Poor ventilation with a combustion source can lead to dangerous buildup

Generators and carbon monoxide

Need very careful use

Not inside the home

Not in the garage or storage room

In a ventilated outdoor location

Away from windows and doors

Not near sleeping areas

Follow the manufacturer's instructions

No unsafe wiring

Important message: An outdoor generator near windows can allow gas to enter the home

Charcoal and grills in enclosed spaces

Among the most dangerous causes

**No charcoal for heating
inside the home**

No grills inside rooms

Not in closed tents

**Do not move burning
charcoal**

**Make sure it is fully
extinguished**

Message: Charcoal can keep producing dangerous gases even after visible flames fade

What to do if you suspect carbon monoxide

Priority is exiting and calling for help

Don't return before the danger is gone

5

Have devices inspected by a specialist

6

Don't put yourself at risk to rescue someone unconscious

7

Get outside to fresh air immediately

1

Don't stay to find the source

2

Alert everyone present

3

Call 999 from a safe location

4

Important message: Quick exit is more important than trying to find the gas source

Do and Don't for carbon monoxide prevention

Right practices and ones to avoid

Don't ×

No charcoal inside the home

1

Don't run a vehicle in a garage

2

No generator inside the home

3

Don't block ventilation openings

4

Don't ignore the alarm sound

5

Don't return before it's confirmed safe

6

Do ✓

Install alarms

1

Test them regularly

2

Provide proper ventilation

3

Maintain appliances

4

Generators outside only

5

Report any malfunction

6

Protecting the most vulnerable

They are affected more quickly

Children

The elderly

People of
determination

Respiratory
and heart
conditions

Pregnant
women

Sleeping
people

Alarms in
sleeping areas

Message: Prevention must consider every family member's needs

Interactive Scenarios

Practical application of what you learned

Scenario 1 The carbon monoxide alarm goes off

Correct action: Get out to a well-ventilated area and call emergency services

Scenario 2 Someone wants to use charcoal in a closed room

Correct action: Stop them and explain the danger of carbon monoxide

Scenario 3 The generator is near an open window

Correct action: Move it to an outdoor location away from windows and doors

Scenario 4 Multiple people feel headache and dizziness

Correct action: Get outside immediately and call for help

Test your knowledge

Quick questions to assess your understanding

Q1: Can carbon monoxide be seen or smelled?

Answer: No, it is a colorless and odorless gas

Q2: Is charcoal allowed for heating inside the home?

Answer: No, because it can produce carbon monoxide

Q3: What do you do when the alarm sounds?

Answer: Exit to a well-ventilated area and call for help

Q4: Where should the generator be used?

Answer: Outside only, away from windows and doors

Q5: Why do we maintain heating devices?

Answer: To reduce faults and incomplete combustion

Thank you

Carbon monoxide safety is everyone's responsibility

Install an alarm • No charcoal indoors • Generator outside • Ventilation • Don't ignore symptoms • 999

"Preventing an invisible danger starts with awareness and early warning"
